The Effect of Immigration on Local Labor Markets: Lessons from the 1920s Border Closure

by: Ran Abramitzky, Philipp Ager, Leah Boustan, Elior Cohen and Casper W. Hansen

September 30, 2021

The 1920s U.S. border closure substantially reduced immigration, with uneven effects on regional economies.

RWP 21-09, September 2021

In the 1920s, the United States substantially reduced immigration by imposing country-specific entry quotas. We compare local labor markets differentially exposed to the quotas due to variation in the national origin mix of their immigrant populations. U.S.-born workers in areas losing immigrants did not gain in income score relative to workers in less exposed areas. Instead, in urban areas, European immigrants were replaced with internal migrants and immigrants from Mexico and Canada. By contrast, farmers shifted toward capital-intensive agriculture, and the immigrant-intensive mining industry contracted. These differences highlight the uneven effects of the quota system at the local level.
