Emerging markets have responded foremost to domestic inflation when raising rates during U.S. tightening cycles.

The Federal Reserve’s interest rate hikes in 2022–23 raised concerns about spillover effects on smaller emerging market and developing economies. Historically, a higher U.S. federal funds rate has been associated with international investors withdrawing capital from emerging markets, which can lead to lower economic activity and depreciating exchange rates in these markets—and, in turn, greater financial vulnerability. To reduce capital outflows, central banks in emerging markets can tighten their own monetary policy rates to increase yields on debt securities. But raising interest rates comes with trade-offs, and how central banks in emerging markets respond to tighter U.S. monetary policy remains an empirical question.

Johannes Matschke, Alice von Ende-Becker, and Sai A. Sattiraju examine the three most recent U.S. policy tightening cycles to analyze when and why central banks in emerging markets raised their own policy rates. They find that while emerging markets sometimes raised rates in response to capital outflows or a depreciation of their currency resulting from U.S. monetary policy, they more frequently raised rates in response to domestic inflationary pressures. Their findings provide new descriptive evidence on the conduct of monetary policy in emerging markets.

Johannes Matschke
Economist

Johannes Matschke is an economist in the Macroeconomics and Monetary Policy Division at the Federal Reserve Bank of Kansas City. He joined the Bank in 2021 after obtaining his Ph.D. in Economics from the University of California, Davis. He holds a master’s degree in Statistics from the University of Munich and a master’s degree in Economics from the University of Nebraska in Omaha. He received his bachelor’s degree in Economics from the University of Munich. His research explores the implications of financial frictions and international markets on the optimal design of regulatory policies.

Alice von Ende-Becker
Research Associate

I joined the Kansas City Fed after graduating from Trinity University with BA degrees in economics, mathematics, and art history and a minor in medieval and renaissance studies. At the bank, I support Johannes Matschke and Peter McAdam with their research and policy work regarding international macroeconomics, differences in consumption patterns, and financial frictions. Working on these projects provides me with the chance to work with important datasets and assist in relevant research. Additionally, through my collaborations with the economists I am able to strengthen my own knowledge and research capabilities, providing me with valuable skills that will prepare me for future plans. Furthermore, even during a remote work environment, the opportunity to attend presentations by the research staff has proven to be a great resource for further learning and exposure to economic ideas that allow me to explore and develop my own interests.
