## The KCFSI suggests financial stress fell modestly in April, resuming its gradual decline since summer 2010.

The Kansas City Financial Stress Index (KCFSI) was -0.49 in April, down modestly from -0.37 in March. The decline in April reversed an uptick in March, continuing the gradual decline in the index since July of last year. As a result, the KCFSI remained below its long-run average of zero for the sixth consecutive month.

Six of the eleven variables making up the KCFSI declined from March to April, while two variables increased. Changes in measures of asset price behavior reduced the KCFSI by a total of 0.04 point, and changes in yield spreads lowered the index by an additional 0.08 point. The variables with the biggest negative contributions to the change in the index were the implied volatility of overall stock prices (VIX), which subtracted 0.07 point, and the consumer ABS/5-year Treasury spread, which deducted 0.04 point. The two variables with positive contributions to the change in the KCFSI were the correlation between stock and Treasury returns and the cross-section dispersion of bank stock returns, both of which added 0.02 point.

| Consumer ABS/5-year Treasury spread                             | -0.04                           | 2                              |
| <b>Behavior of asset prices</b>                                 | <b>-0.04</b>                    |                                |
| Correlation between stock and Treasury returns                  | 0.02                            | 10                             |
| Implied volatility of overall stock prices (VIX)                | -0.07                           | 1                              |
| Idiosyncratic volatility of bank stock prices                   | 0.00                            | 8                              |
| Cross-section dispersion of bank stock returns                  | 0.02                            | 11                             |
| <b>Total</b>  | <b>-0.12</b>                    |                                |

Note: The contribution of each variable equals the change in the standardized value of the variable times the coefficient of the variable in the index. Contributions may not add to totals due to rounding.

## Frequently Asked Questions

**What is the KCFSI?** The KCFSI is a monthly composite index of 11 variables reflecting stress in the U.S. financial system. These variables fall into two broad categories--average yield spreads, and measures based on the actual or expected behavior of asset prices. The index is calculated using the principal components procedure. Under this procedure, the coefficients of the 11 variables are chosen so that the index explains the maximum possible amount of total variation in the variables from February 1990 through the current month. Further details on the variables and the construction of the index can be found in Section II of “Financial Stress: What Is It, How Can It Be Measured, and Why Does It Matter?” by Craig S. Hakkio and William R. Keeton, *Economic Review*, Federal Reserve Bank of Kansas City, Second Quarter 2009.

**Why are past values of the index sometimes revised?** Most revisions are due to recalculating the index using the additional data from the current month. These revisions are inherent in the principal components procedure and are explained in more detail in Appendix B of the article by Hakkio and Keeton. Other changes in past values of the index may result from revisions to the data used to construct the variables. Finally, the index may occasionally be revised due to a change in the data sources or in the method of constructing a variable. In this last case, an explanation for the revision is included in the monthly summary.

**How should the index be interpreted?** A positive value of the KCSFI indicates that financial stress is above the long-run average, while a negative value signifies that financial stress is below the long-run average. A useful way to assess the level of financial stress is to compare the index in the current month to the index during a past, widely-recognized episode of financial stress, such as October 1998. For more information on interpreting the index, see Section III of the article by Hakkio and Keeton.
